

Cassia Essential oil China

Cinnamomum cassia Nees ex Blume

Spicy
Hot

Botanical family : Lauraceae
Method of culture : Conventional
Part harvested : Leaves

CAS TSCA : 8007-80-5
INCI : Cinnamomum cassia leaf oil

Specifications

Method for obtaining : Steam distillation

:

Appearance : Yellow to reddish brown mobile liquid

Constituents : Cinnamaldehyde, o-methoxycinnamaldehyde

Harvest period

Chinese cinnamon, also called Chinese cassia, is an evergreen tree, often pruned to the size and shape of a shrub to facilitate harvesting. Originally from China, it grows semi-wild or is cultivated in the southeast provinces of Guangxi and Guangdong. The tree's leaves are typical of the genus *Cinnamomum*: heavily veined, smooth, and oval. It belongs to the same family as Howood. The small, pale-yellow flowers produce fruits the size of an olive. The trees reach maturity at the age of 10 to 12 years. The leaves are harvested, dried, and then distilled, resulting in an essential oil that is spicy and woody, with a delectable, almondy facet.

Chinese cassia has been known to mankind for nearly 5,000 years. Descriptions of its uses could be found in the Chinese Pharmacopoeia under Emperor Shen Nung around 2,700 B.C. Highly favored by the imperial court, it was also used in traditional cooking. It came to be known by its "cinnamon" name and is mentioned in Sanskrit texts and the Bible. This common name comes from the Greek kinnamon, kinnamômon, meaning "spice of China." As Arab merchants travelled the Spice Road, they took great care not to reveal their supply locations, and this contributed to the legends surrounding the cinnamon tree. People in ancient times were fascinated with it: It was said that it could only take root in extraordinary locations. In the Song of Songs, Solomon mentioned a sensual garden fragrant with nard and saffron, cassia and cinnamon.

Advised uses : Aromatherapy, Perfumery, Cosmetic, Alimentary
